Abstract: Social networks provide facilities such as sharing, hosting and upload and manage images that are shared and transferred online social network. And it relates to providing photo sharing to transfer user or post pictures online digital images for easy downloading and viewing of both sites and applications. It can also be used by the user to manage photo galleries and photo blog that can make the pictures show, but not allow them to upload photos. If the user is allowed to post and comment and mark the image and then can reveal the user's privacy, so to solve this problem it is to explain the various systems that can identify everyone in the picture. And share photos with a group of people with the help of online photo sharing, which provides users with several innovative alternatives. many social networking sites to share images that help users in publishing photographs of the family is offered, friends and family nearby. safe loading ensures image and makes each individual present in the image to be aware of the activity as well as publish them to participate actively in the activity of the implementation of the image. This system is considered the needs of users, and focuses on privacy issues, and the behavior of current users and take into account concerns about protecting the privacy of individuals.

Keywords: Images Of Privacy; Social Networking; And Secure Multi-Party Account; And Collaborative Learning;

I. INTRODUCTION

Social networks have become an important part of the networks of everyday social life. Online (OSN) as Face book, Google and the sound of the birds they are originally designed to make people able to part personal information and the public and make social contacts with friends, coworkers, people like to have a position, family, and even strangers. To maintain the integrity (of danger) user events, it became a way to control something big point of OSN. However, it is eternal scored once some photos / image / uploaded is published. The final results can be dangerous, and people can be used for purposes other than several unexpected. For example, it can reveal the relationship mafia published in any of the celebrities. Usually it includes user profile information about users to work at their date of birth, sex, residence, interests, education, and travel information and be in contact information. Moreover, users download the image and mark others even though they are willing or not willing to be part of the image / downloaded content. When the mark in others the situation becomes more complicated. Download user fully aware of the consequences of a person who is involved in marking or image. Today no one can stop a situation like this is not inevitable. We need to control this type of actions to reduce the risks of tagged images or loaded. Instead of imposing restrictions on such incidents or to increase security, and sites like Facebook and Instagram are encouraging people to get into this kind of things. Sometimes more than one user is ready to get the

exposure parameter or without your permission. It is a violation if you look image without permission of all persons who participated in the photo? To answer this we have to explain the problems of security and privacy in social networks. Each time an image is shared and inclusive security, which can be placed at risk if the request is not appropriate permissions. We need to impose a maximum security and privacy of content uploaded to social sites. Even while using social networks on the Internet, one can feel the confidence required and the level of security. He / she can make the confidence to use social networking sites without having to worry or images to be shared in an unsafe manner and unauthorized. desired level of privacy and security is the first thing that is important to the user by using social networking sites on the Internet. As for the architecture and applications of current social networks, whether used alone because of the latest security restrictions imposed various security threats will be affected due to a major security mechanisms. Few authors study on security issues due to the lack of joint control or cooperative on the images that have been shared through social networking sites on the Internet.

II. LITERATURESURVEY: BACKGROUNDANDRELATEDWORK

1) A document entitled "On the way to meaningful internet systems".

Author: M B. Carminati, E. Ferrari, and A. Perego.

The degree of edibility of the progress of work management systems greatly affects the way business processes are executed. And deliberate on constraint-based to become more flexible than traditional models because the meanings of words representation: everything that does not violate the restrictions is permissible. Despite the claims on the basis of enrollment, flexible, and changes the description process may be necessary to comply with the development of commercial areas in exceptional cases. Flexible and can be expanded by supporting the operation of the dynamic changes of time. The transfer of cases to form a new ad hoc changes. Changing the definition of the process, for example. The overall framework proposed for the modeling language constraintbased and implementation processes. Focus supports both customized and dynamic changes.

2) "common facial recognition to improve the explanation in the face of collections of personal photos on social networking sites," the paper over.

Author: Muhammad Bellare, C. Namprempre, and Nevin G.

By using facial explanation for effective management of personal images online, the proposed framework to identify new face facial health awareness by leveraging cooperative explanation of the many available on OSN recognition engines effectively. In particular FR cooperative framework consists of two main sections, select FR and FR engines integrate multiple results. The target engine selection FR in determining a set of customized FR engine which are suitable for the query of facial images belong to a particular user. To this end both the social context of network group on social networking sites and social context in showrooms prey phone. In addition, to take advantage of the availability of multiple outcomes FR recovered from the FR engines selected two effective solutions to integrate the results of face recognition to take outdated techniques to integrate many of the results of experiments with seeds were carried out using approximately 547,000 personal images that are collected on the site of existing social networks. The results show that this method gives a more accurate matching of the face of traditional approaches to recognize that only make use of a FR engine. It was also shown that the cooperation framework FR has a low computational cost, and comes with a decentralized design.

III. THE PROPOSED SYSTEM

Problem Statement

Propose a facial recognition system to maintain the privacy of the exchange of images that can identify all members of the image enables each person in the picture is on alert for the implementation work

and participation in decision-making, whereas the publication of the image.

The system architecture

The mechanism to make users aware of the activity published design and get them actively involved in the dissemination of images and making model that advises facial recognition system (FR) that can identify all present in the image-making. If more privacy options is not done and can limit the number of images that will benefit from the training system FR group. In order to overcome this problem and to establish a training system FR users use images that distinguishes the image co-owners without compromising your privacy. Method was developed based on a distributed consensus that would protect private training set and even reduce computational complexity. And below our contributions to this work, compared with the previous work:

We can find potential owners of common images automatically, even when using labels generated as an option in our document is retained.

Images of a way to maintain the privacy of social contexts and to derive a personal to propose any particular user in our FR engine.

They suggest agreed to achieve privacy and efficiently.

The implementation of the proposed system

We will propose that people can view the image to submit notifications before posting any image on the Internet. It will differentiate or detect the faces of people affected by getting the other person who posted the photo online. He noted the proposed framework with low cost, classify and prepare a set of hypothetical research and analysis aimed to demonstrate the suitability and effectiveness of the account. This method of sharing photos is more reliable and effective in maintaining security and privacy on social networking. The application that is being implemented in Nexus 7 tablets, and uses the API of Android Jelly Bean, and FB SDK. They used a software library library is open to the vision of FR computer. It was designed to be part of a graphical user interface for this application. It has provided start-stop buttons on the GUI. Once the user has logged greetings along with a personal photo will be displayed. In the system configuration will generate a decision tree. To do this, the group of personal and private training means that the user is using his gallery. Each time this process for detecting moving objects in the user needs to determine close friends. FB survey to all recognized users have an average of 150 friends and between about 35 close friends. Each user must have installed this application. In creation mode is selected and the process works to create a group where we can share the image starts, based on

privacy and policy statement. Currently in social applications on the Internet you can not customize the list of friends. But here we can implement it. When the image is deployed is clicked on "participation" it is sent to indicate the image for all users who are partners in the ownership of that image. Co-owner the right to accept or reject the invitation. After that the owner can share photos, and if he were to rejection and said he can not publish the photo.

IV. CONCLUSION

photo sharing is the process of sending or transmit digital images to the Internet user. Individuals identified in one of the participants in the image by the FR system proposed. The system detects a detailed description of our system. Overall, the result can be achieved by consensus refine often as a result of the local formation. Several sites that offer services such as uploading, hosting and photo sharing management (public or private). These functions provided by the sites and applications to facilitate the downloading and viewing photos. This term can even be useful for online photo gallery that fit over and managed by individual users, including photo blog. Using a game system with two users to demonstrate design principle. System, which was built in the manner of build FR personality of the year with more than two users has shown. The system can reduce the loss of privacy by using this design, providing inspiration to the co-owners and the owners even during the generation of random prosecutor's office.
